Introduction: We are introducing new method of application of our Panchgavya Liquid Organic manure Spray mixture (that is 10 Litres water + 10ml PGLOM, as an instant **Soil Booster**.

Soil Booster

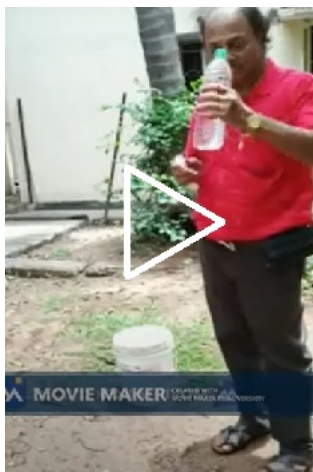

General Benefits of Soil Booster:

- Improves soil structure and aeration
- Feeds beneficial soil microbes
- Supplies nutrients for root uptake
- Earthworms multiply in very large numbers
- Create Organic soil conditions
- Lively soil with plenty of good bacteria
- Promotes the growth of beneficial microorganisms
- Generally enriches soil

In this method instead of spraying the PGLOM Water mixture as Foliar Spray, the 10 litres PGLOM Water mix is added to 15 to 16 litres of dry loose soil, and soaked for 15 to 20 minutes, then applied to the soil as Soil Booster.

The following steps are involved:

1. First prepare, 10 Litres PGLOM Water mix, following the video given below.

10 Litres Water + LOM Strong mix preparing Video
<https://youtu.be/rALIpXPbjxA>

2. Making 25 kgs Soil Booster: Take a 25 litres bucket. In this bucket take up to 15 litres (or 16 litres) dry loose soil. Pour or add with this, 10 litres preapred, PGLOM Spray mixture. Mix by a Trowel 4 or 5 times only. Leave it as it is for 15 to 20 minutes. Now 25 litres or 25 kgs Soil Booster is ready.

Trowel

If dry loose soil is not available, take 15 litres wet soil, add 10 litres PGLOM water mix, Mix by a Trowel 2 times only. Just leave it as it is for 15 to 20 minutes. Always prepare in 2 numbers 25 litres buckets to save time.

Two 25 Litre Buckets

3. This prepared 25 kgs/litres can be spread over an area of about 4400 square feet. Thus about 10 buckets like this will be required to apply this Instant Soil Booster for one full acre.

4. How to apply or spread Soil Booster?: Take out in small basins of about 5 litres/Kgs at a time, and throw by hand over the agri field.

5. Ideal time for applying this is on empty land, just before seeding or planting new saplings. Or this can be applied when plants height is only about 6 or 8 or 10 inches, so the Soil Booster thrown reaches the soil and do not fall on plant leaves. In case of row plants or creepers or trees, this can be applied anytime, as soil around roots are mostly visible. Generally give a gap of 10 days, (both before and after), between PGLOM Spray and this Soil Booster applying.

**Barren Lands****6 or 8 or 10 inch Crops**

6. Plenty of watering required over the soil just before applying this Soil Booster. This is just solid Soil Booster, cannot be absorbed by plant roots. So plenty of watering is required, by proper irrigation method or by drenching method, before applying this Soil Booster. so this Soil Booster gets mixed with water and goes below soil, for enriching the sub Soil.

6A. For Wetland Crops: Apply plenty of water to the fields before applying this Soil Booster. This helps Soil Booster to dissolve in water and seep down the soil, so the sub soil is enriched.

6B. For Dryland crops: For this purpose, make small plots with in the fields, apply plenty of water to each plot, make water standing in the field, then apply this Soil Booster. This helps this Soil Booster to dissolve in water and seep down the soil, so the sub soil is enriched.

**Water Irrigation**

7. Digging soil around trees and plenty of watering is essential for this Soil Booster application.

8. 100% Organic (Low Cost) farming is possible with our Panchgavya, by applying this Soil Booster and by spraying method of applications. Very high yield can be expected compared to chemical farming. By using this Soil Booster and PGLM water mix spraying, farmers can totally avoid chemical fertilizers or pesticide and can achieve 100% Organic farming.

9. If chemical fertilizer applied in the soil, recently, do not apply this Soil Booster for 30 days from the time of applying chemical fertilizers. After 30 days you may apply this Soil Booster.

10. Frequency of Soil Booster application: For short term Crops generally apply once in 15 days for first 2 or 3 times only, then apply foliar spray only. For Trees apply once in a month initially, then apply once in 2 or 3 months.

In area where spraying is not possible, like in high raining zones, or mist falling zones, soil application may be continued once in 15 days or 20 days to get good harvest.

Plenty of watering is required for this Soil Booster to work, so irrigate the field well with water, before this Soil Booster application.

11. This Soil Booster suits Paddy fields and some wetland crops where water is always standing in the fields.

For Dryland crops: For this purpose, make small plots with in the fields, apply plenty of water to each plot, make water standing in the field, then apply this Soil Booster.
